Our Session Takeaways

- Describe the principles of proactive change management and explain how they reduce uncertainty, improve stakeholder engagement, and support successful organizational outcomes.
- Evaluate organizational changes through the interconnected lenses of people, process, and technology to identify dependencies, risks, and opportunities.
- Apply the framework to common change scenarios, including AI adoption, technology implementation, workforce challenges, and crisis response.
- Identify strategies for building stakeholder trust through communication, governance, feedback, and user-centered implementation practices.
- Develop practical actions that enable organizations to make confident, courageous decisions while maintaining business continuity and long-term adoption.

Hello!

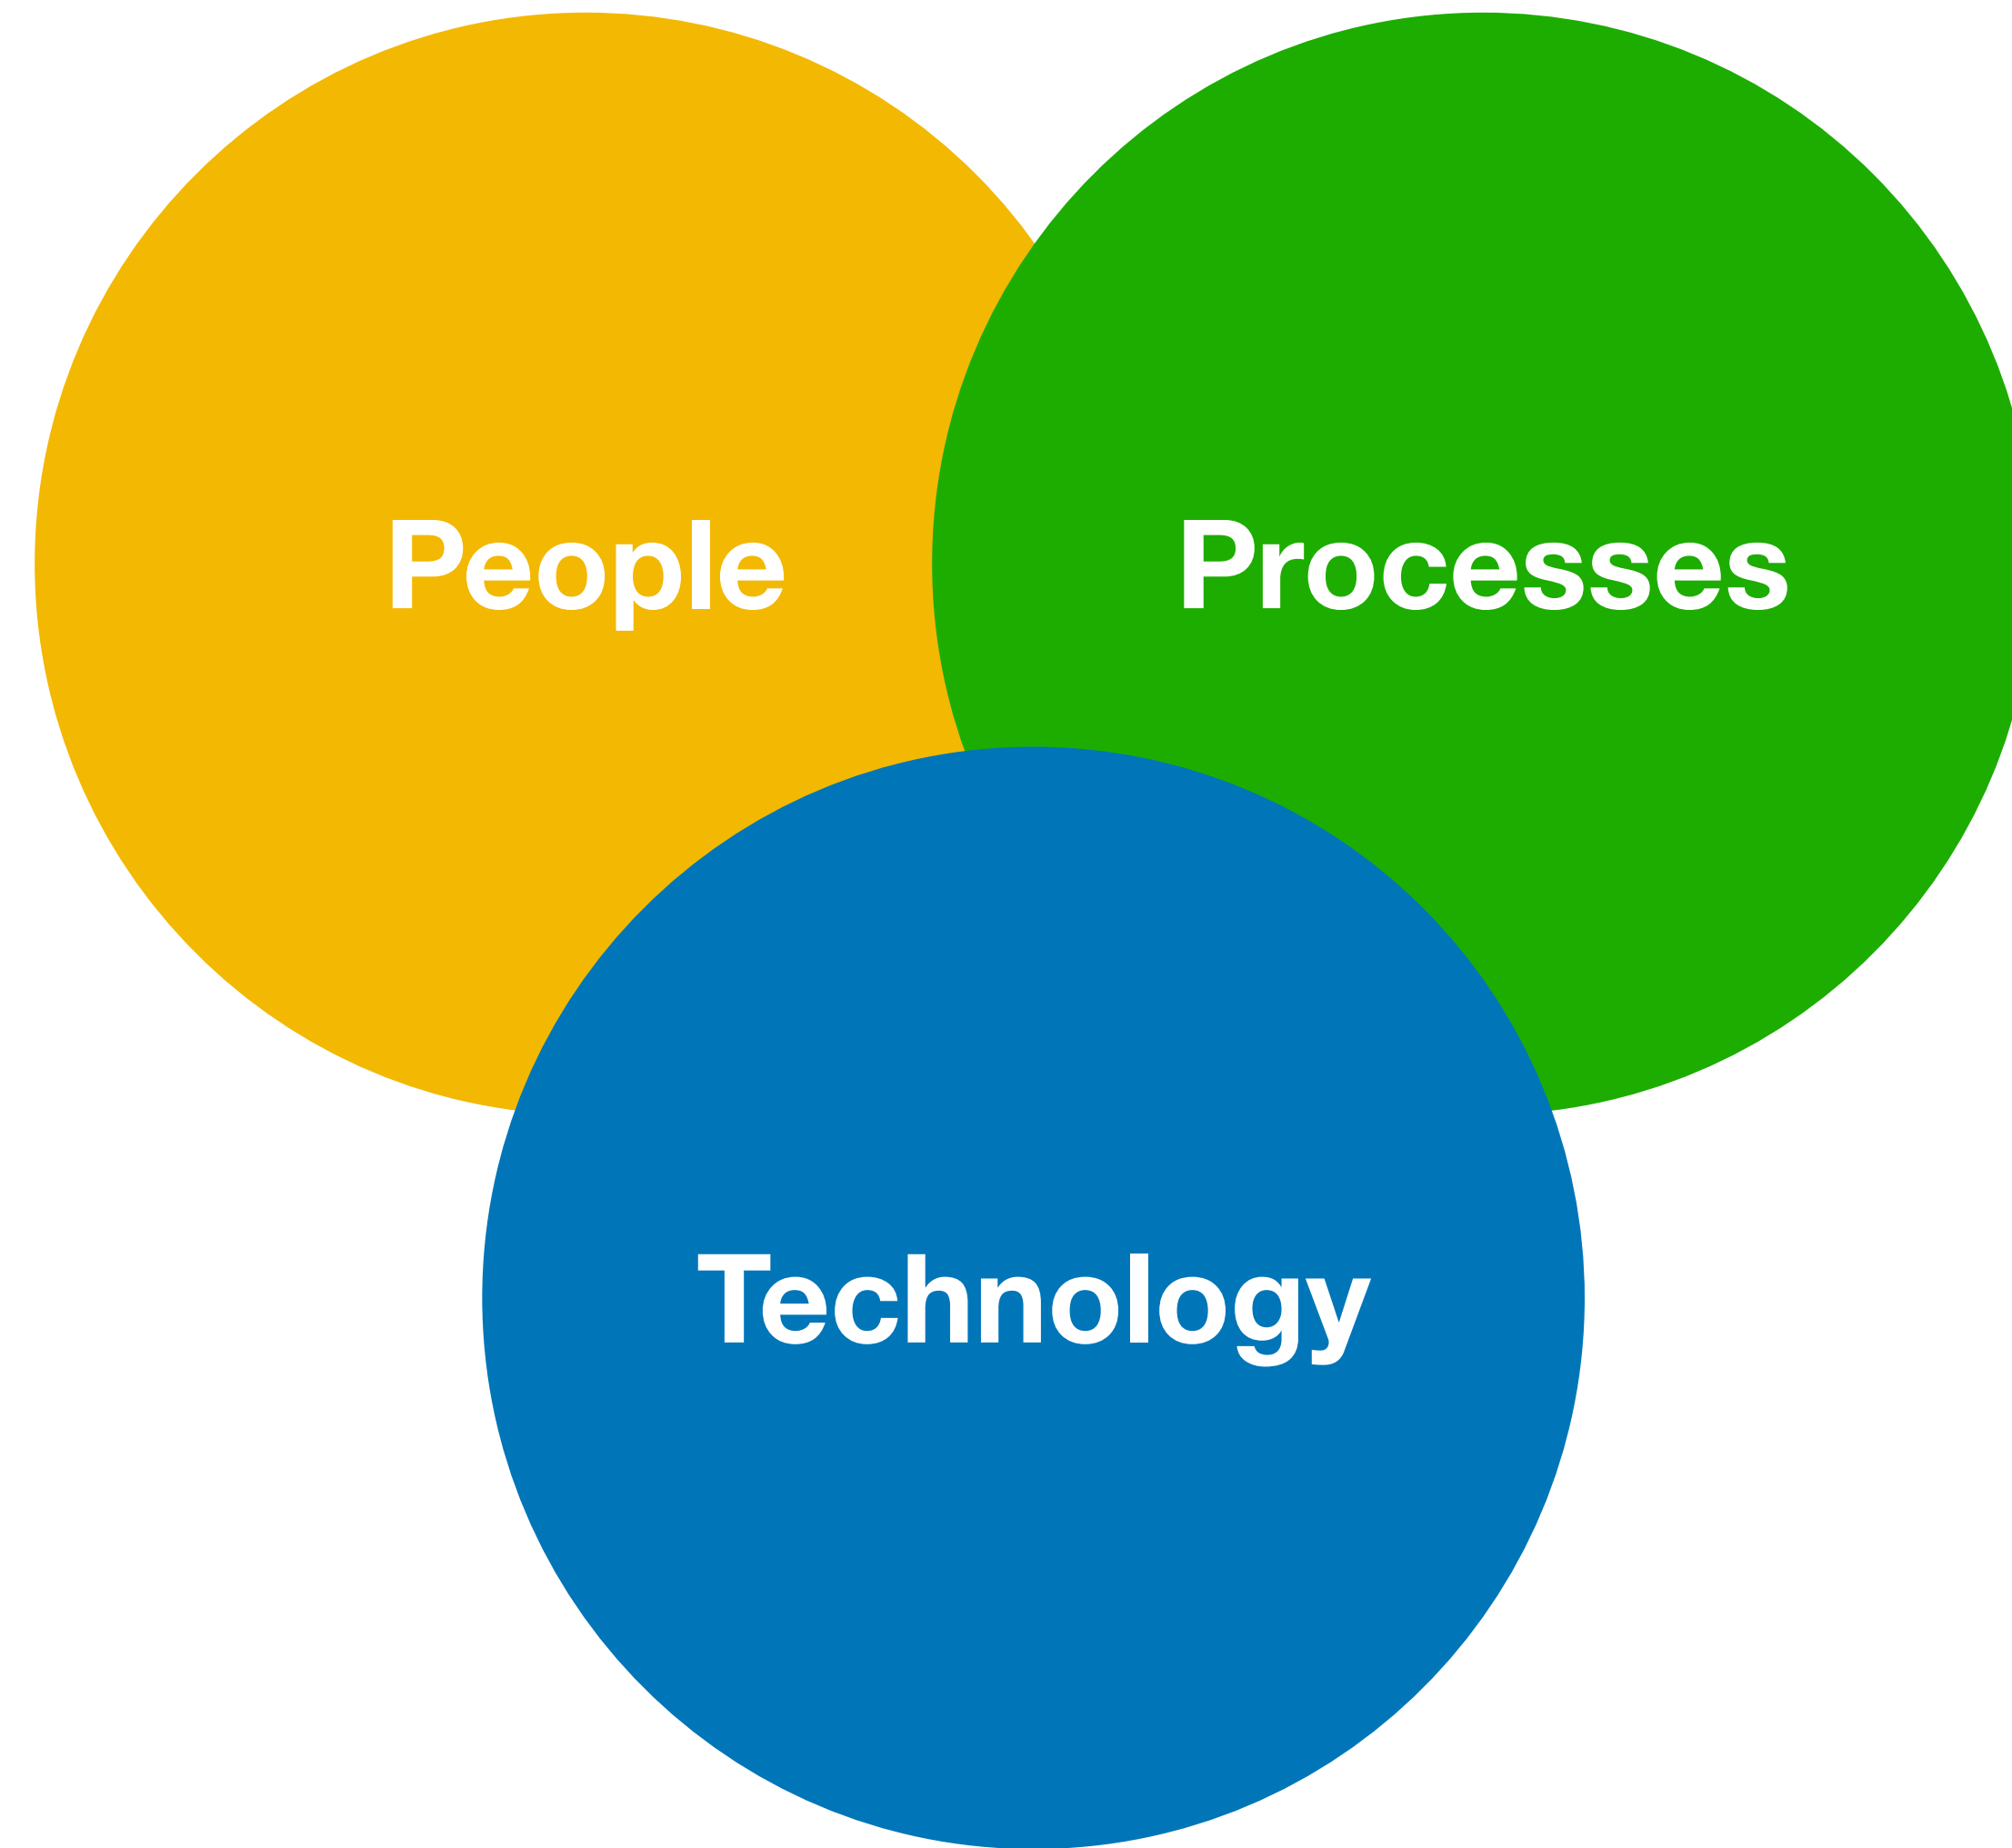

What is Change Management?

“Fear is a reaction. Courage is a decision.”

-Winston Churchill

- Proactive approach
- Outcome can minimize confusion, boost morale, maintain business continuity of operations
- Takes into account impacts, dependencies and all stakeholders

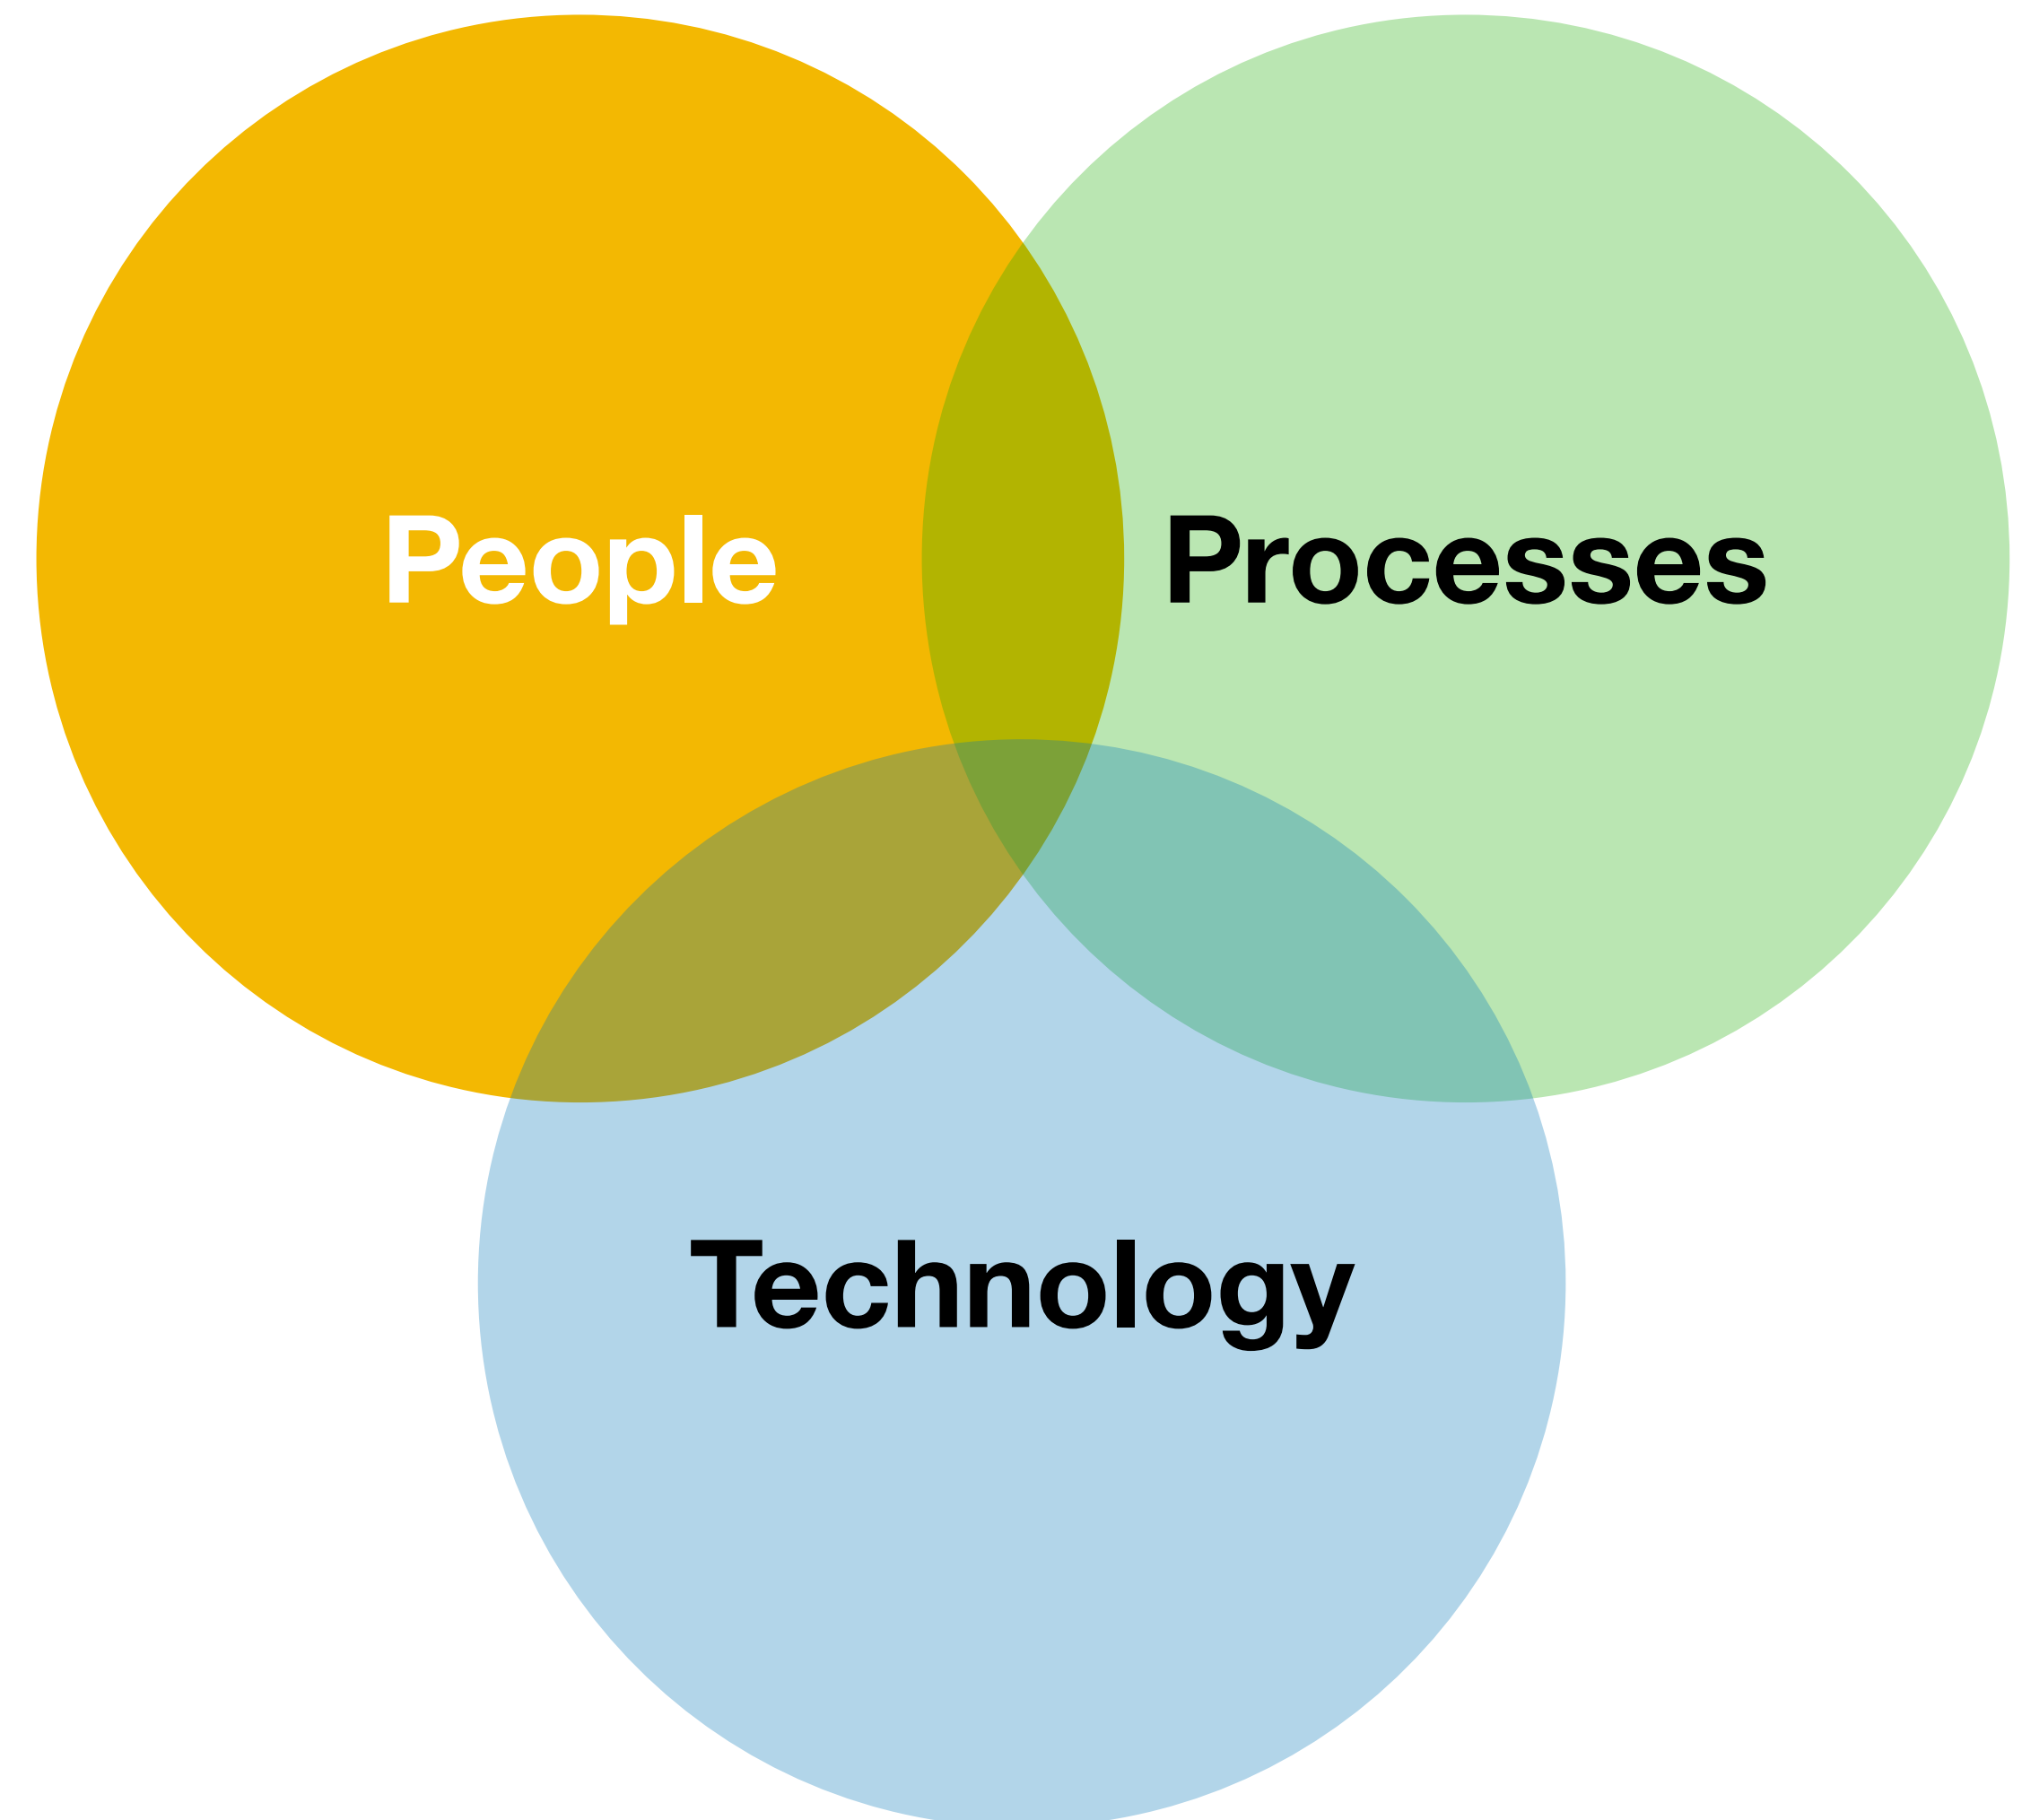

Let's get started!

Download me!

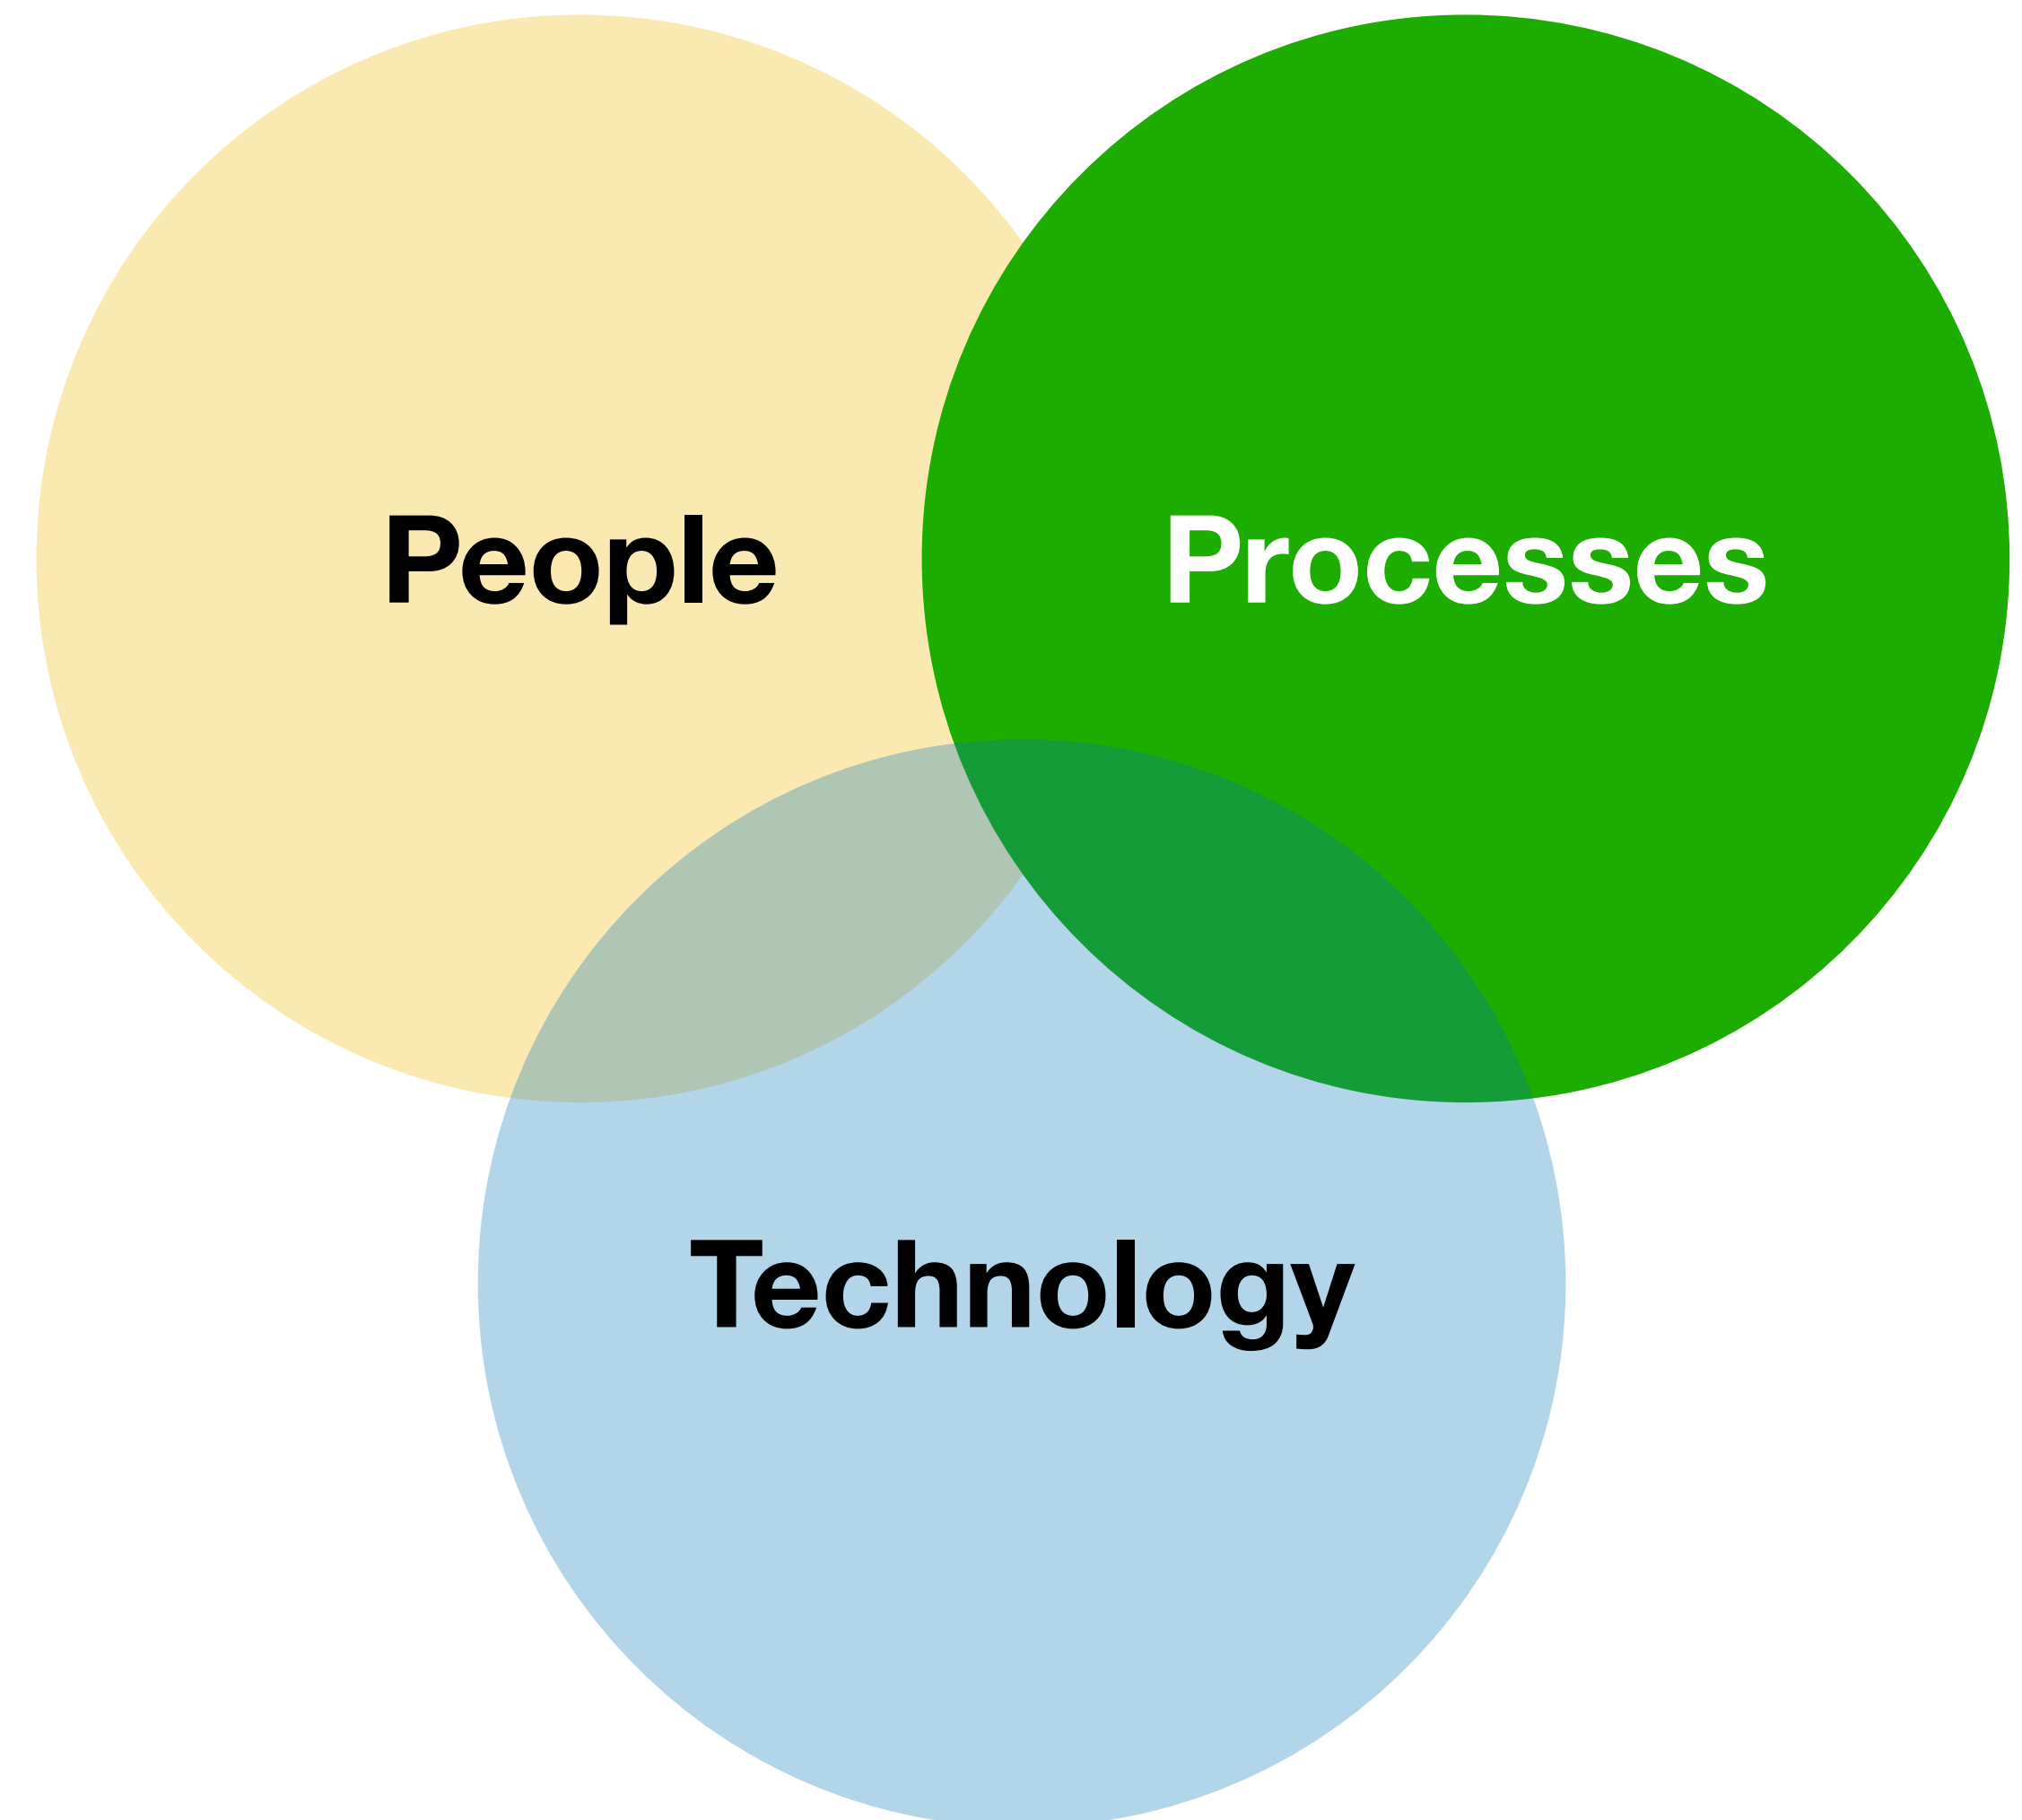

The Delicate Balance: People

- Managing change is about managing expectations
- Transparent, proactive communication builds your brand
- Acknowledging the fear
- Consider the end user

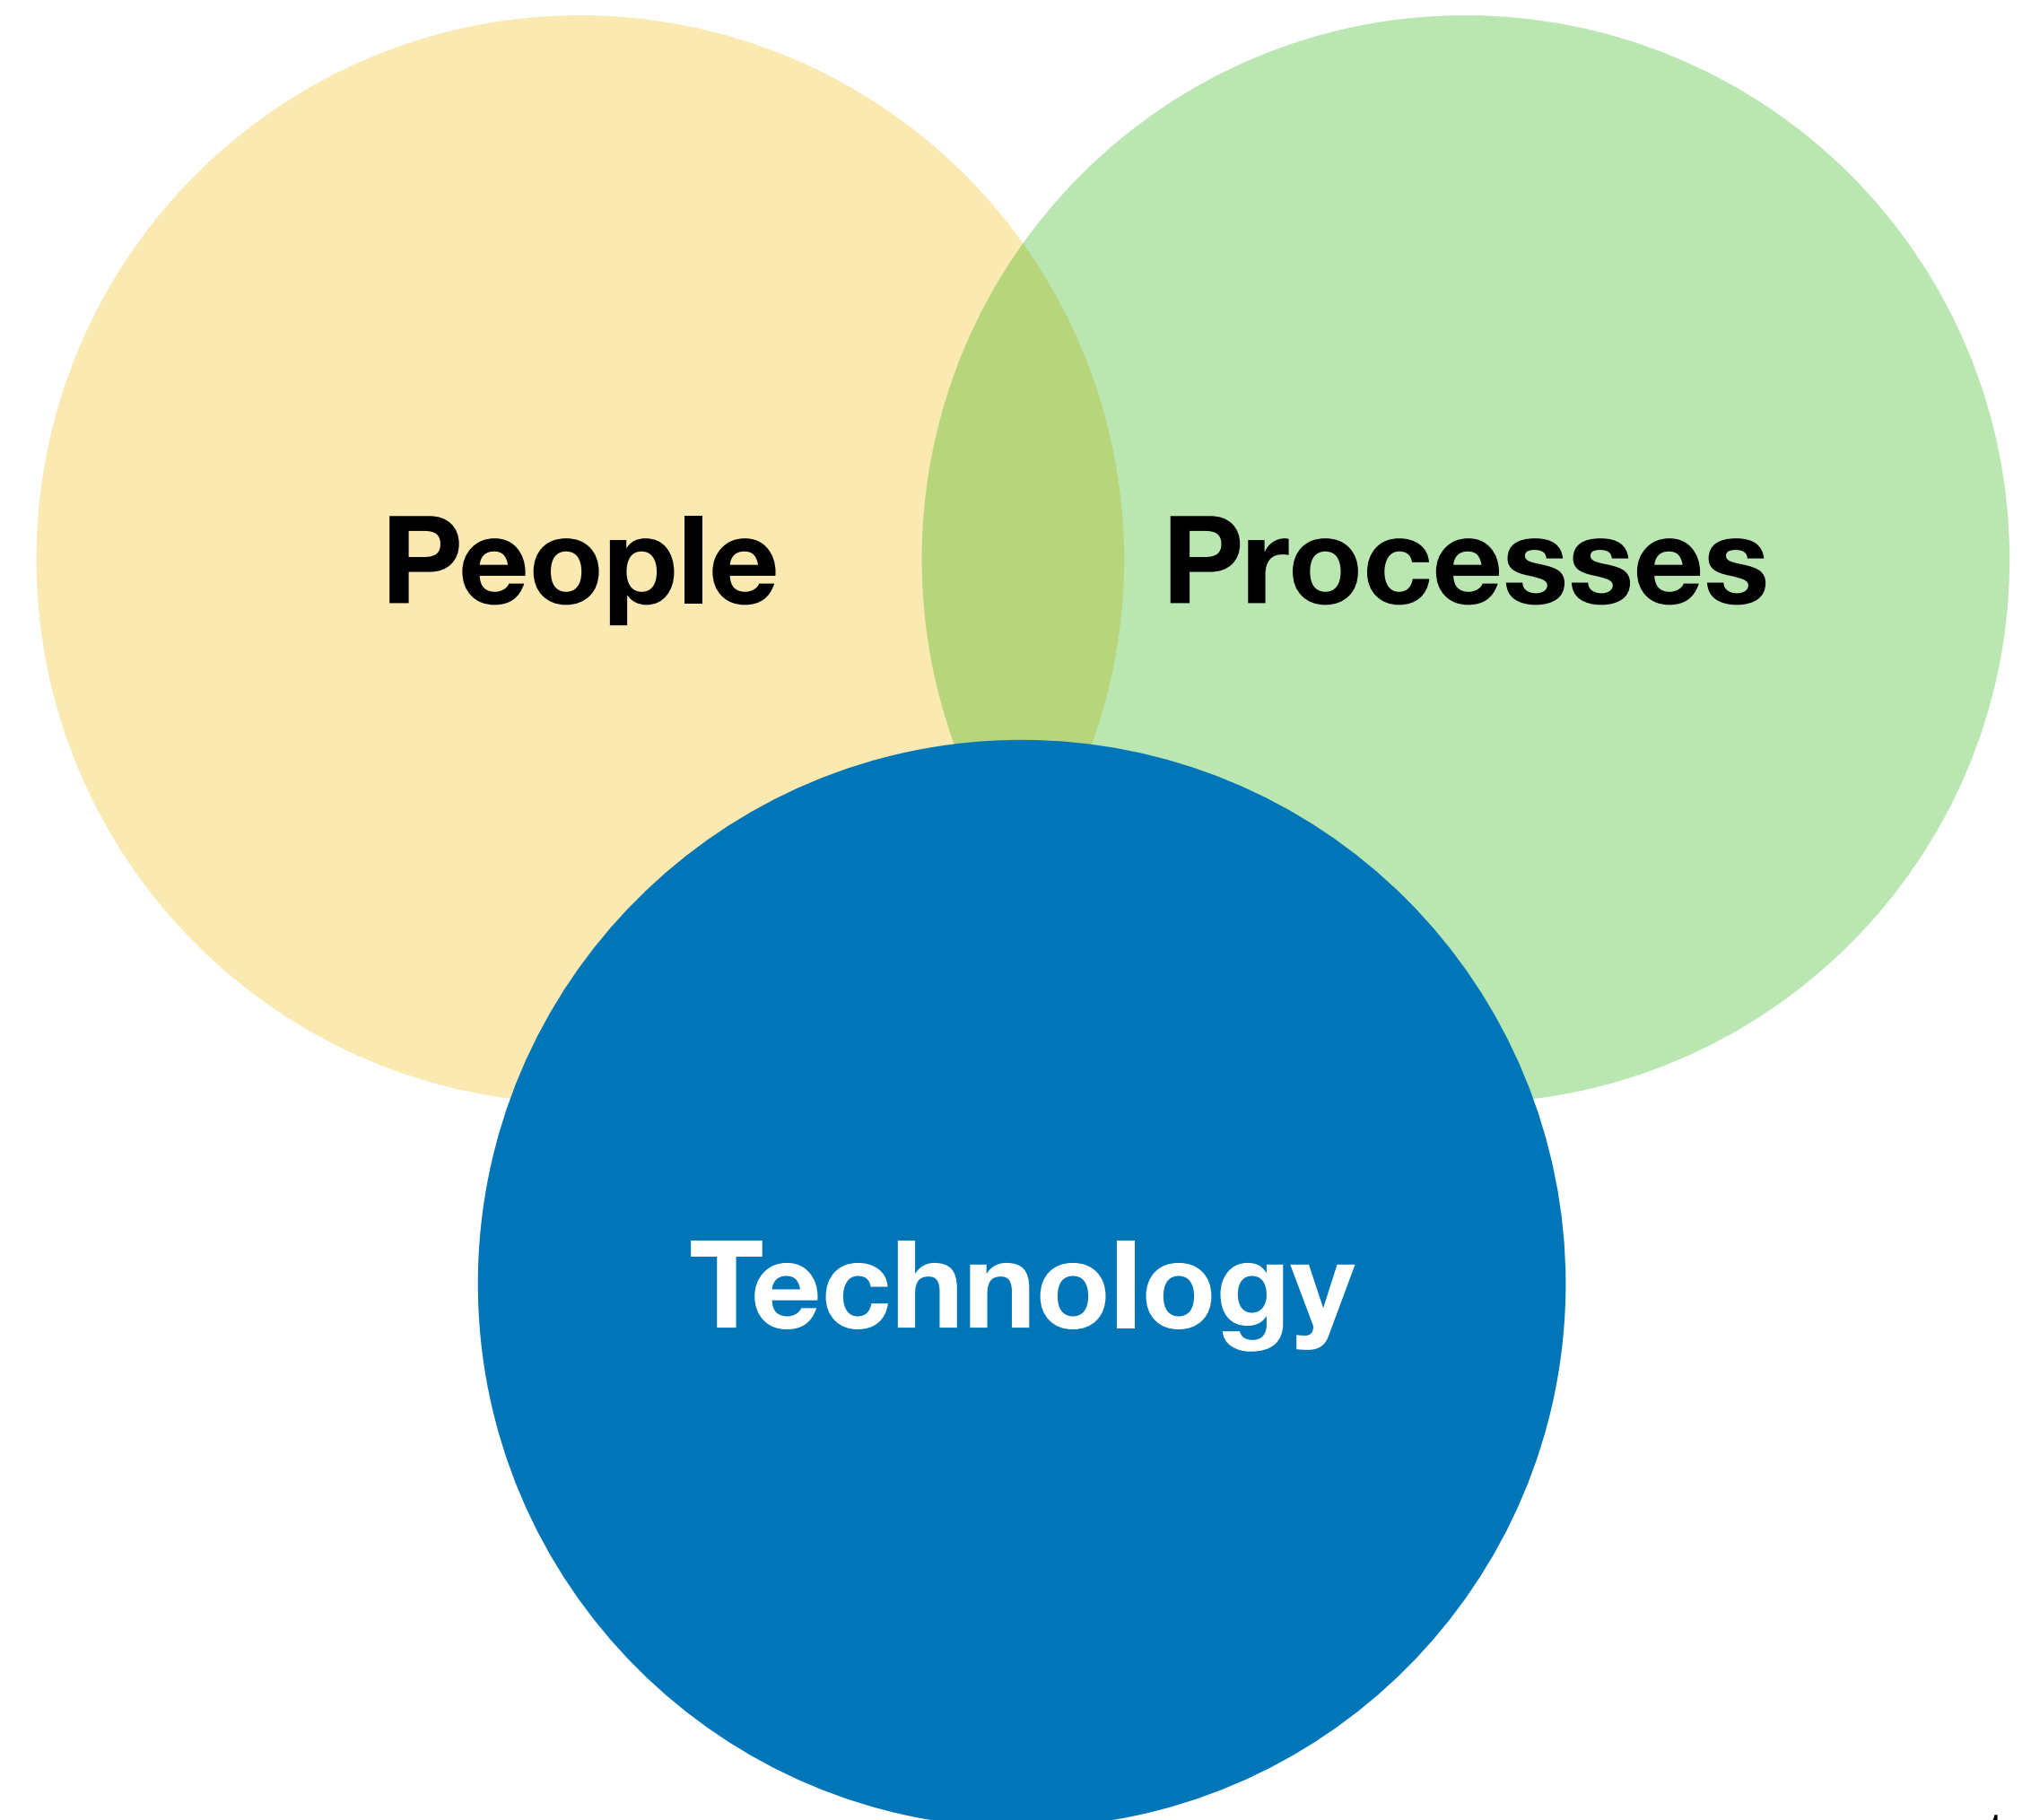

The Delicate Balance: Processes

- Fix processes, not people
- Document, share, learn
- Take in feedback and act on it; give feedback with tact

The Delicate Balance: Technology

- Good tools make processes work
- Make it easy for internal and external stakeholders to understand and buy-in

Use Cases

[AI Adoption](#) | [Burnout & Workforce Retention](#) | [Crisis Response](#)
[Using Data in Decision-Making](#) | [Implementing a New Technology](#)
[Build versus Buy](#) | [Corporate Restructuring](#) | [Outside of Work](#)

Use Case: AI Adoption

- People: Build trust early; clarify roles; Upskill opportunities; Champions for change
- Process: Acknowledge that AI doesn't fit into every workflow; Keep the human-in-the-loop; Define and apply governance; Feedback loops
- Technology: Challenges data quality standards, integrations and access controls; Align with user needs; Focus on scalability and interoperability

Use Case: Burnout & Workforce Retention

- **People:** Gather and use feedback; Involve staff in the solution
- **Process:** Reduce administrative burden, especially on repetitive work
- **Technology:** Use automation, AI-assistance, and digital workflow tools

Use Case: Crisis or Disruption Response

- **People:** Establish roles and responsibilities; Clear, concise, and timely communication
- **Process:** Create and maintain documentation (e.g. continuity and response plans)
- **Technology:** Source and use communication platforms, learning management systems, and backup systems

Use Case: Using Data in Decision-Making

- **People:** Data literacy training
- **Process:** Create intervention and review cycles
- **Technology:** Create and use dashboards and early-warning systems

Use Case: Implementing a New Technology

- People: communication the change(s); upskilling on new or improved platform/data; collect regular feedback
- Process: new or improved (standardized) workflows and automations; deprecation of manual efforts
- Technology: bringing in new vendors or new capabilities from existing vendors; configure the platform to support operational needs with as few workarounds as possible

Use Case: Build versus Buy

- People: insourcing or outsourcing resources and associated costs; upskilling/training
- Process: vendor management and/or onboarding; internal ability to support growing business need and scale
- Technology: costs associated with implementation, development/customizations, licenses, training for support/maintenance staff

Ulster Technologies

Use Case: AI-Assisted Clinical Documentation

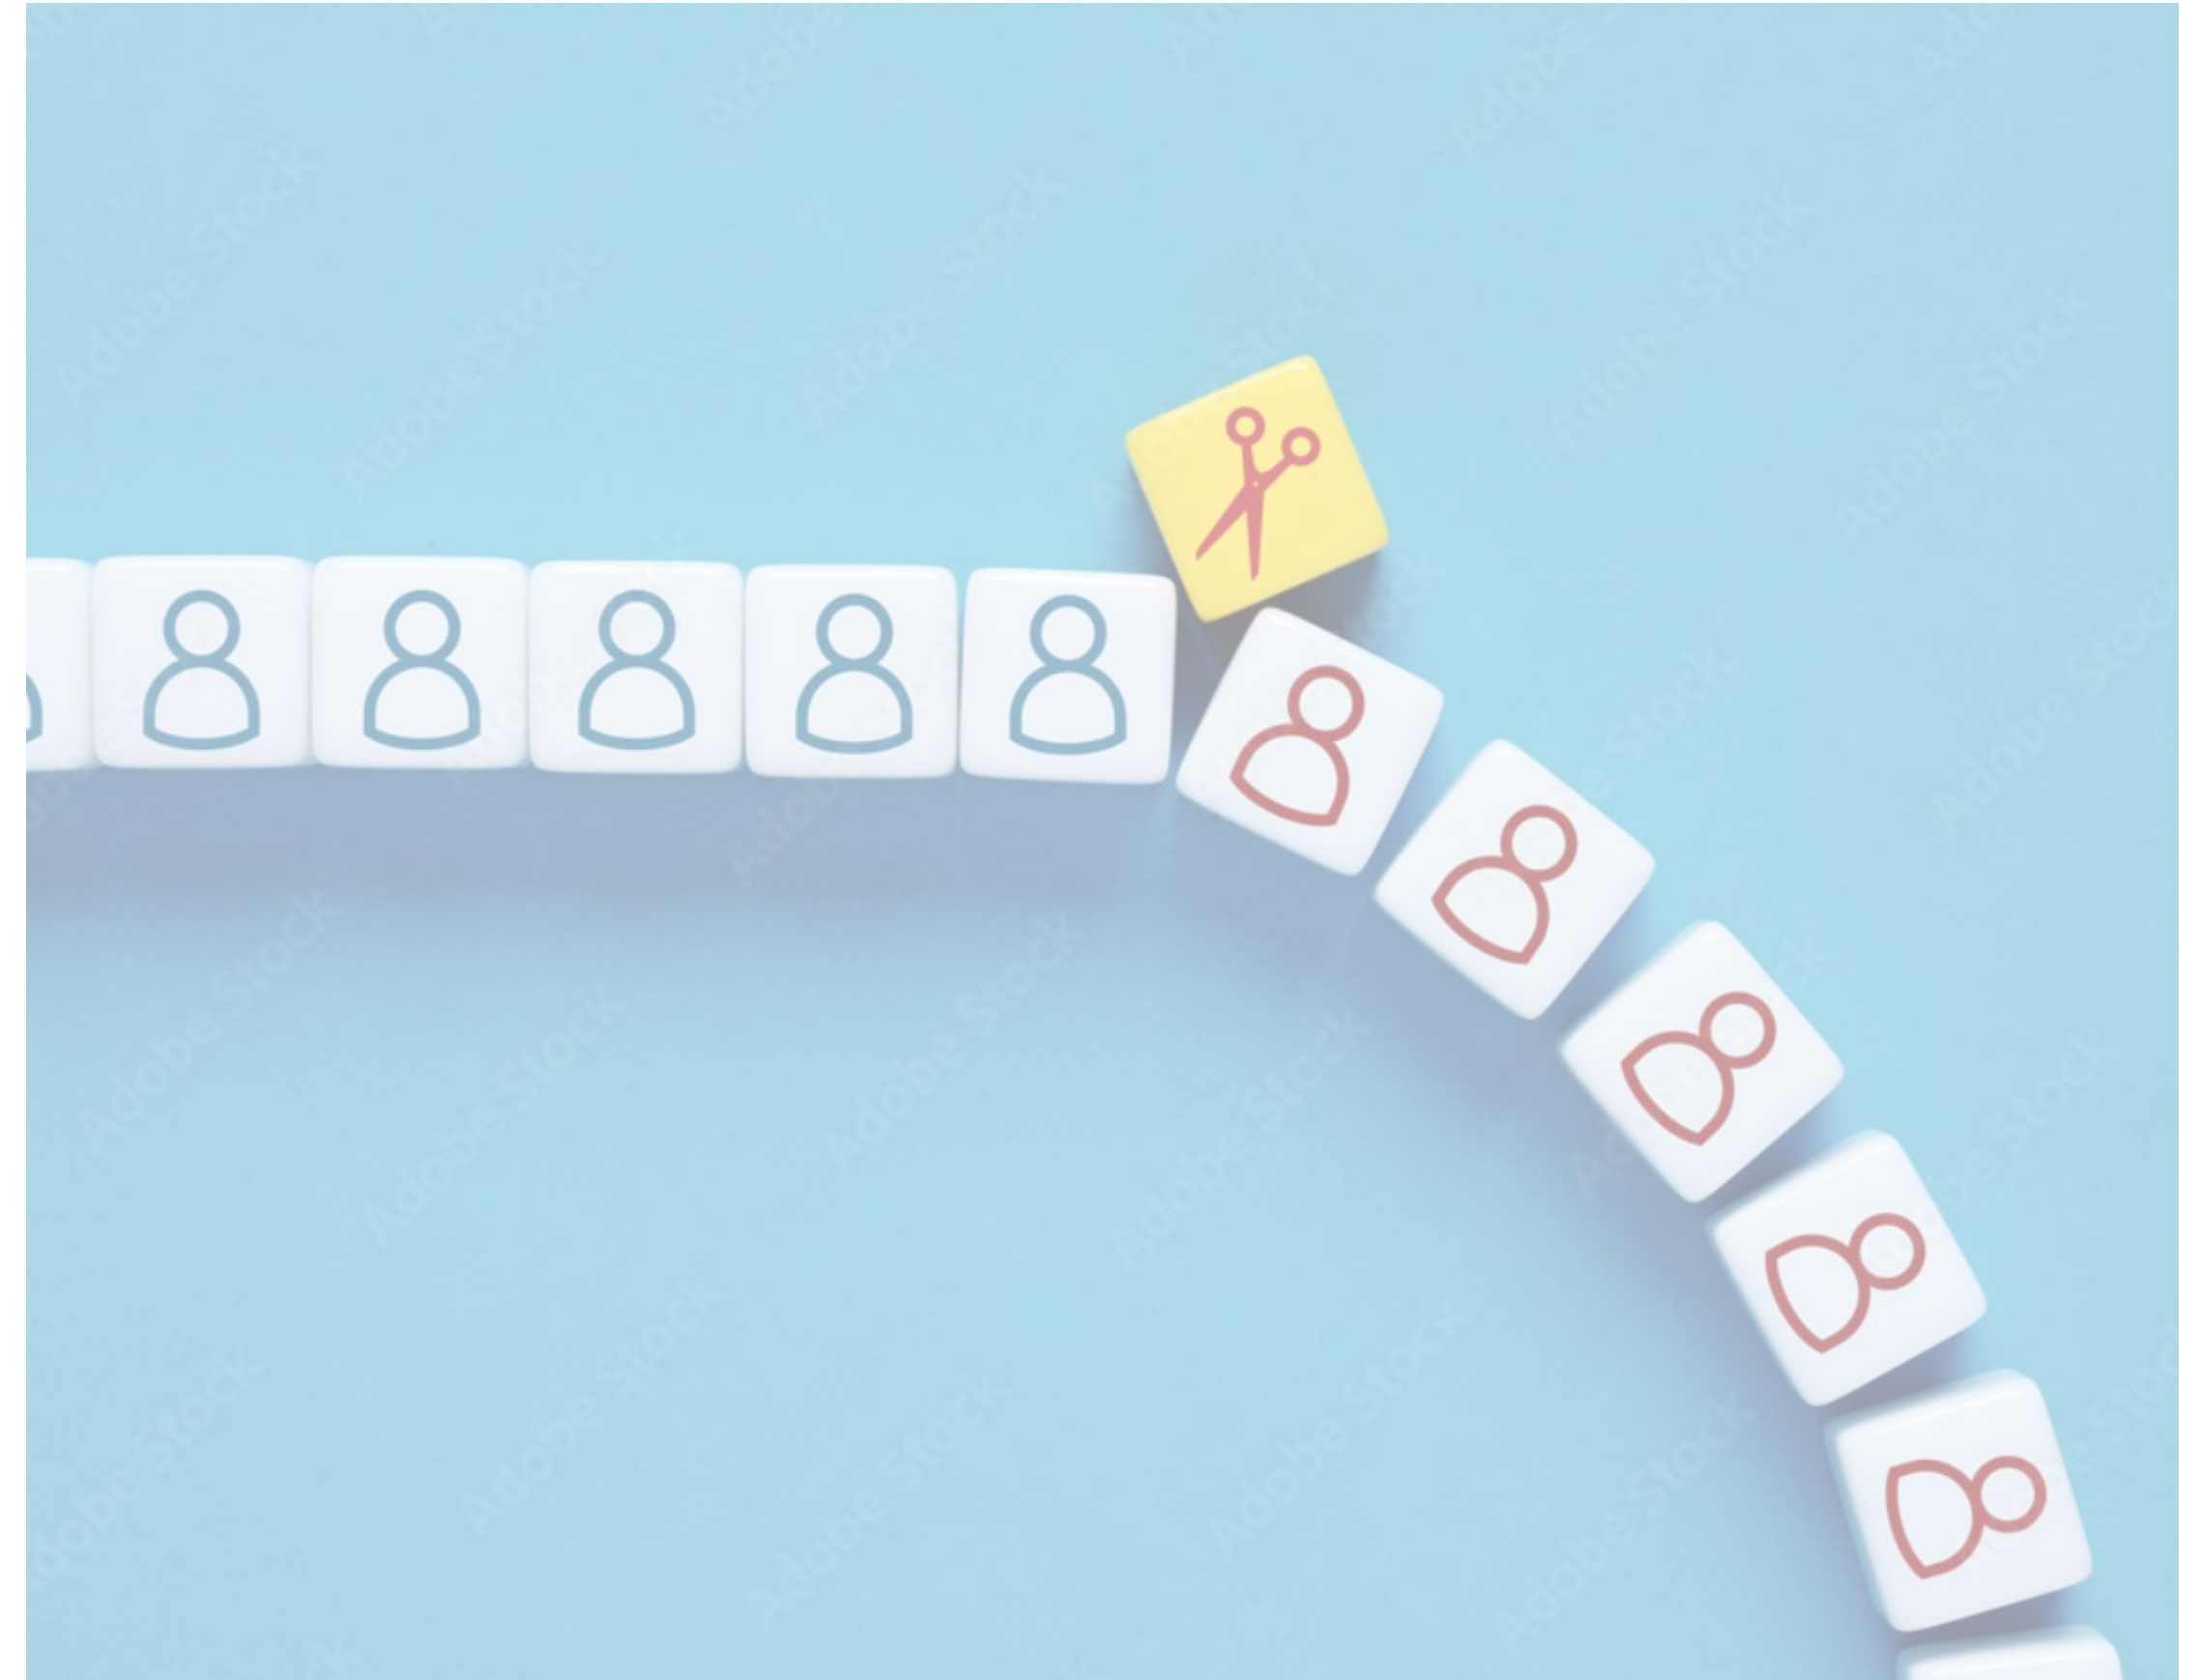

- People: Provider concerns regarding workflow disruption and AI replacing judgement; training; building trust
- Process: Standardizing documentation review workflows, Escalation paths to flag questionable recommendations; Quality reporting procedures
- Technology: AI-powered ambient listening or documentation tools; EHR or downstream integration(s); audit and governance controls

Use Case: Quality Reporting

- People: Data ownership conflicts; Need for executive sponsorship and accountability; Data literacy training
- Process: Standardizing definitions for quality metrics; Governance committees and approval workflows; Data validation procedures
- Technology: Centralized and automated analytics dashboards; Master data management

Use Case: Corporate Structure

- People: Job loss or change; decreased productivity; low morale
- Process: Disruptions or lags; manual processes exacerbated
- Technology: High focus on automations and efficiencies

Use Case: Outside of Work

Ulster Technologies

Image Source

Use Case: AI Adoption in the Classroom

- **People:** Build trust and AI literacy among teachers, students, and administrators
- **Process:** Establish guidelines for acceptable AI use, lesson planning, and assessment practices; Keep the human-in-the-loop; Feedback loops
- **Technology:** Select AI tools with appropriate privacy and security controls; Align with user needs; Focus on scalability and interoperability

Use Case: Implementing a New Technology

- **People:** Engage teachers, staff, students, and families early and often; Collect regular feedback
- **Process:** Standardize workflows; Provide training and support plans
- **Technology:** Configure the platform to support educational and organizational goals with as few workarounds as possible

Use Case: Care Coordination

- People: Providers aligned on shared goals; Proactive awareness and recovery from staff burnout and communication barriers; Patient and caregiver education
- Process: Standardized discharge planning; Follow-up appointment scheduling; Medication reconciliation workflows
- Technology: Predictive analytics to identify high-risk patients; Remote patient monitoring; Automated follow-up reminders

Use Case: Remote Patient Monitoring

- People: Training providers on the data itself; Patient adoption of devices and digital tools; Clarifying ownership of alerts and follow-up actions
- Process: Escalation pathways of abnormal readings; Response time expectations; Documentation standards and data transparency
- Technology: Connected devices and wearables; Patient engagement platforms and mechanisms; EHR or downstream integration(s)

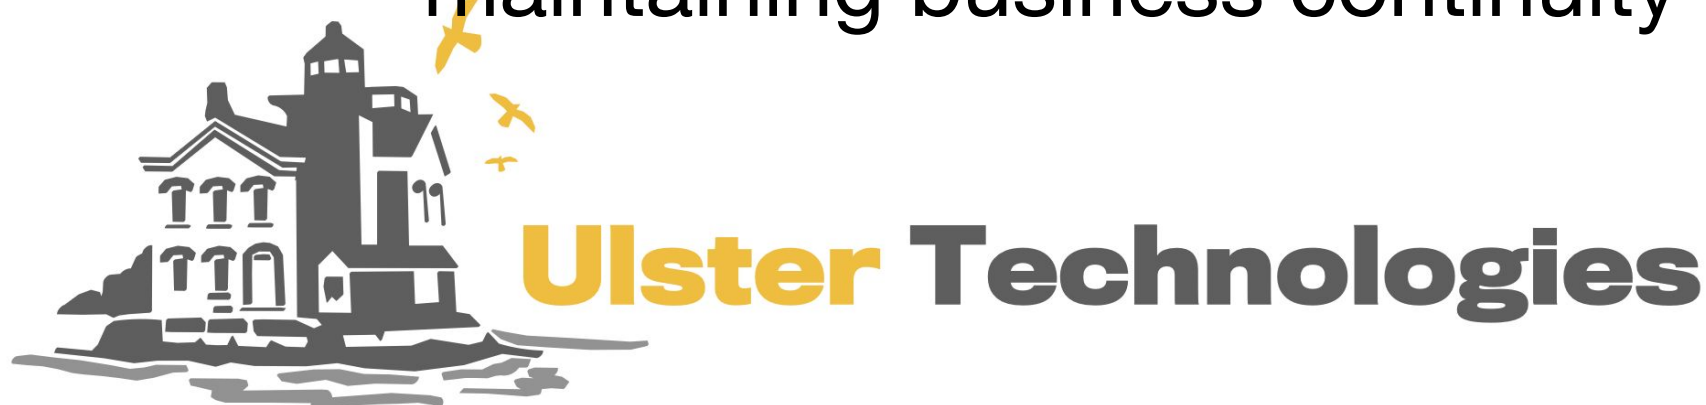

Use Case: SDOH Screening Programs

- People: Sensitivity training to staff; Addressing concerns around stigma and trust; Partnering with community organizations
- Process: Referral workflows for housing, food insecurity, or transportation; Consent and privacy management; Follow up coordination
- Technology: Screening tools within EHR platform; Referral systems; Population health analytics

What We Covered

- Describe the principles of proactive change management and explain how they reduce uncertainty, improve stakeholder engagement, and support successful organizational outcomes.
- Evaluate organizational changes through the interconnected lenses of people, process, and technology to identify dependencies, risks, and opportunities.
- Apply the framework to common change scenarios, including AI adoption, technology implementation, workforce challenges, and crisis response.
- Identify strategies for building stakeholder trust through communication, governance, feedback, and user-centered implementation practices.
- Develop practical actions that enable organizations to make confident, courageous decisions while maintaining business continuity and long-term adoption.

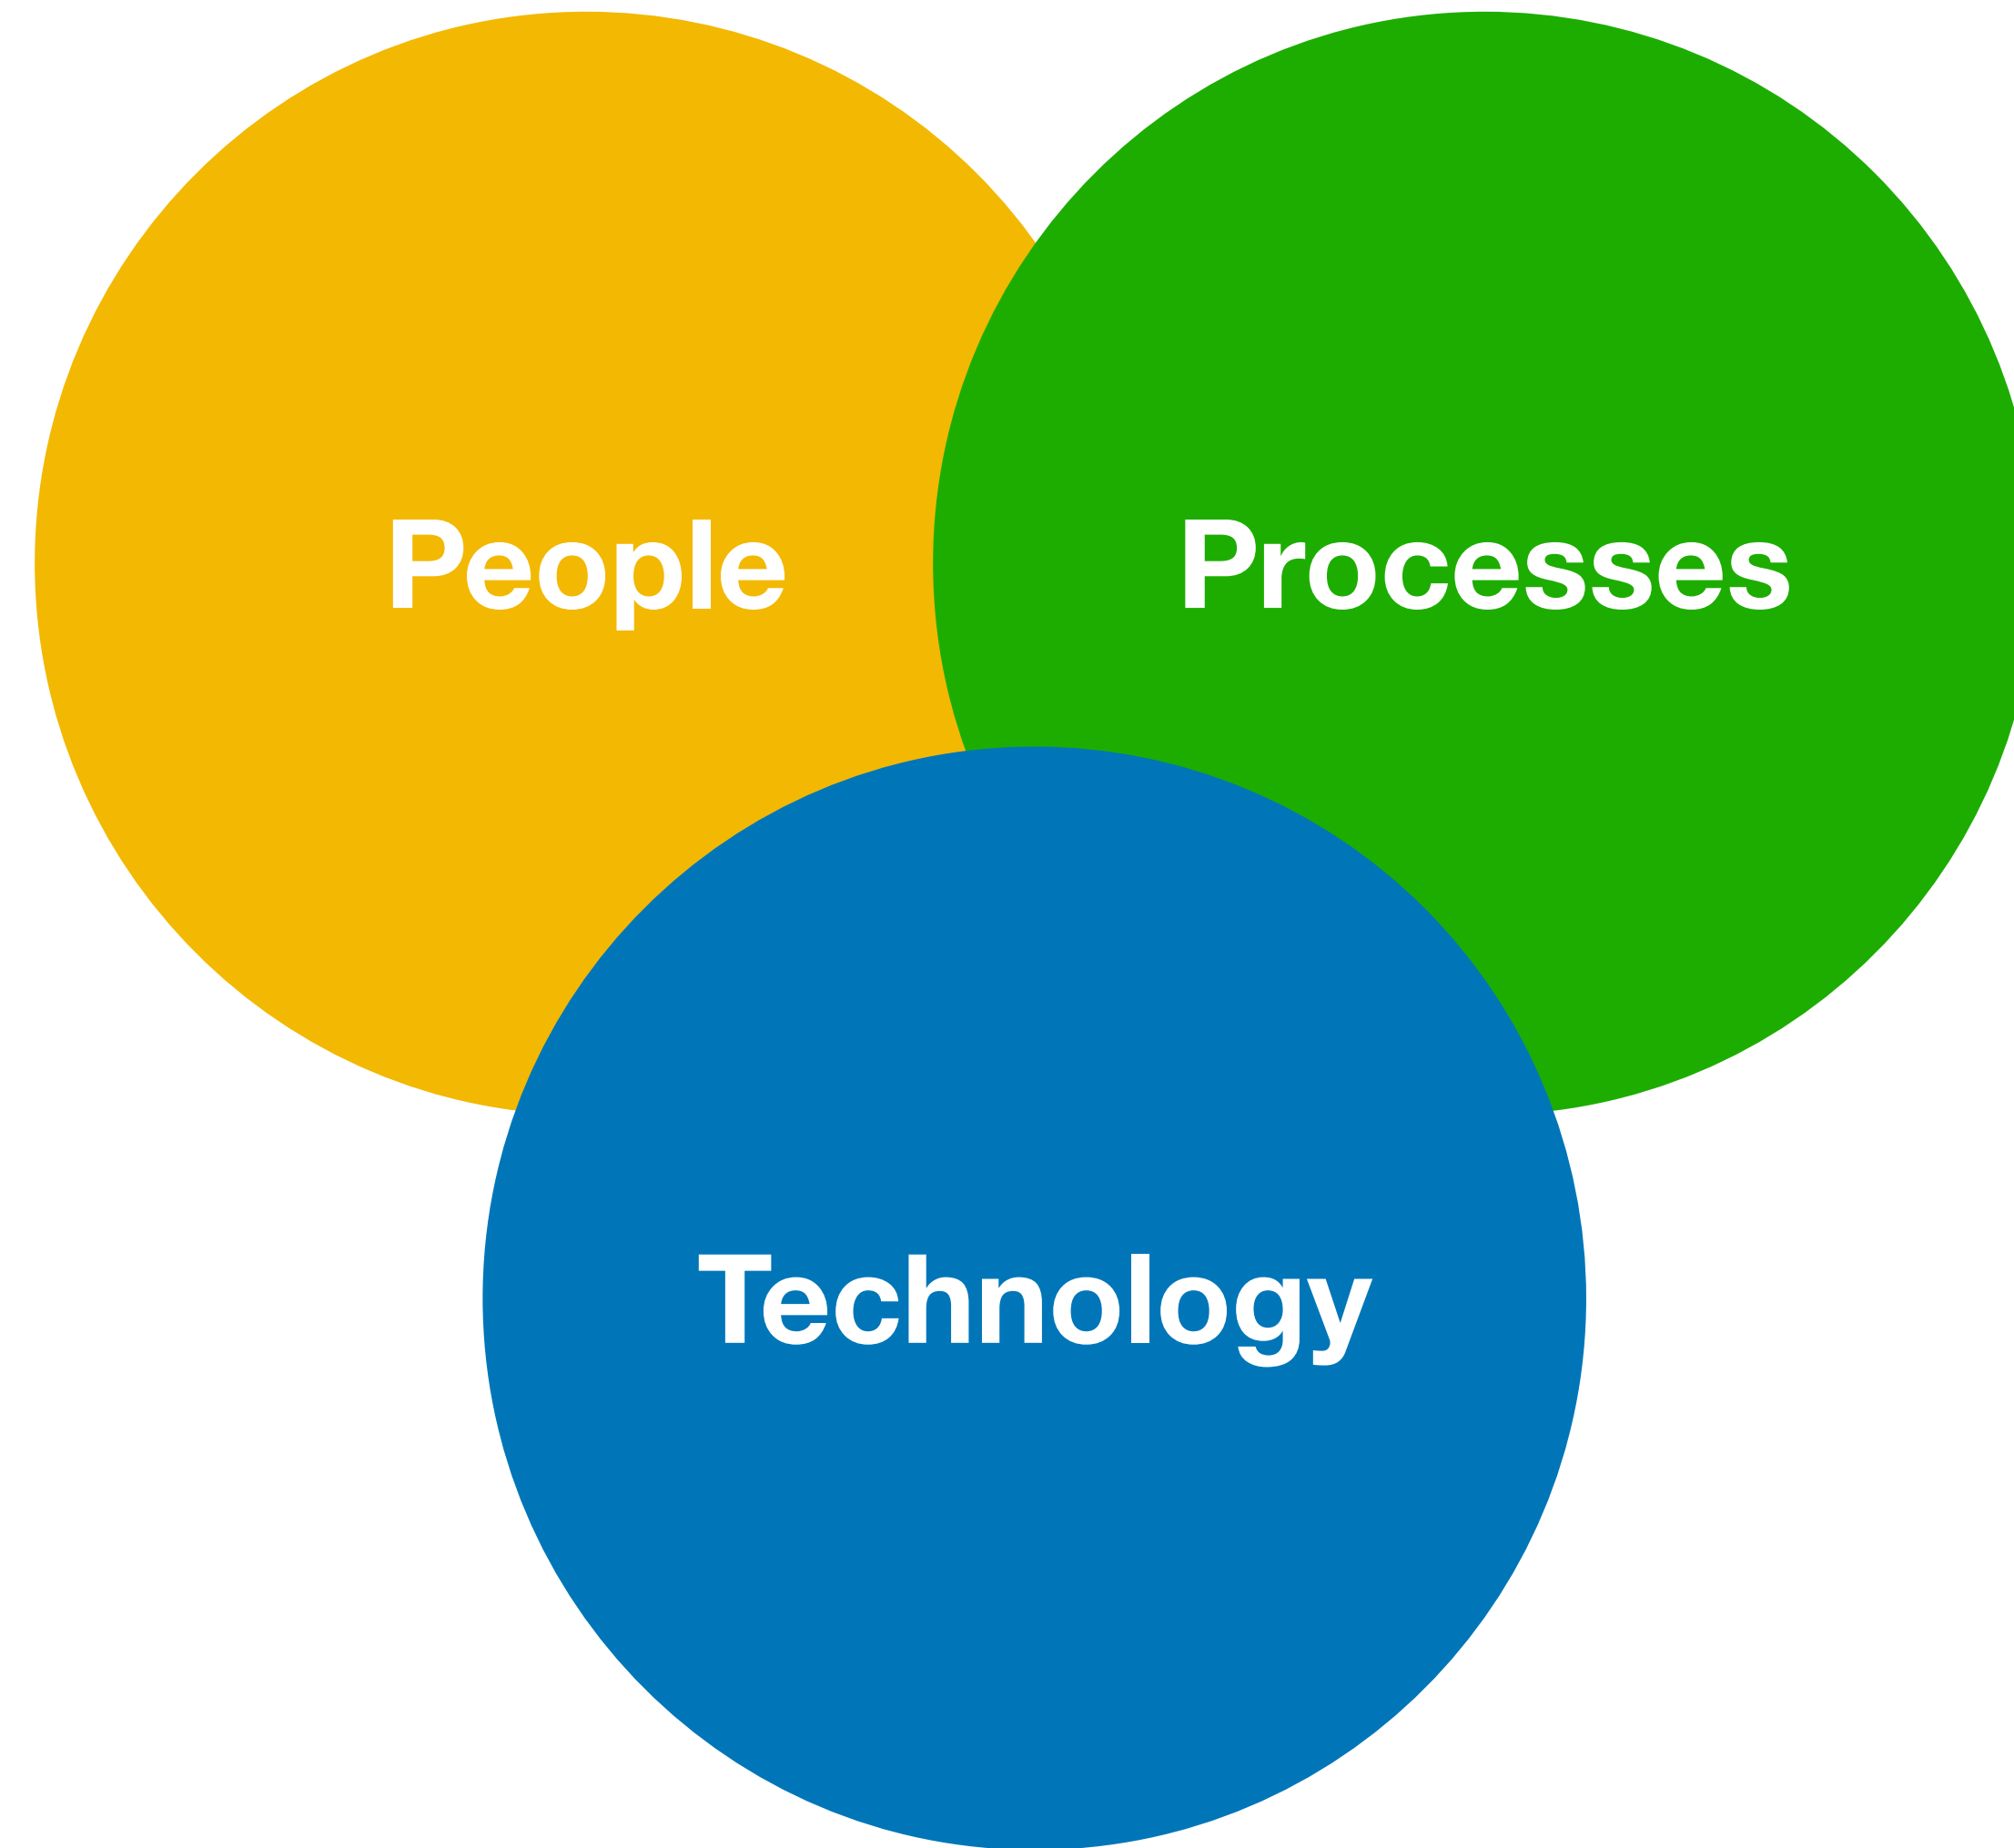

Thank you!
